

EasyVSL IBM Watson Instructions - Using Speech-to-Text

Watch the video tutorial here <https://youtu.be/8AhxUUe7Ck4> or follow the step-by-step instructions below.

First, create a free account on IBM <https://www.ibm.com/cloud>

Run EasyVSL and go to Timeline section->Click on Add audio

Click on Import Audio and add your audio from your computer, then click Open

Click on Auto Speech Recognition button

Click on “Click Here to Get a Free account”

Log in to your IBM account (in case you are not logged in)

Authenticating with Cloud Foundry service credentials

Last Updated: 2020-03-19 [Contribute in GitHub](#) [Open doc issue](#) | [Edit topic](#)

Cloud Foundry service credentials for IBM Watson™ services provide authentication to a service in IBM Cloud™. Service credentials use HTTP basic authentication to authenticate to a specific Watson service.

Note: Watson services that are created in a resource group or are migrated from Cloud Foundry to a resource group use IAM authentication. By default, all new Watson services use IAM authentication. For more information about resource groups and IAM authentication, see [Authenticating to Watson services](#).

Getting Cloud Foundry service credentials

To access API methods by using Cloud Foundry service credentials, you must first collect the credentials. You can access the service credentials from the IBM Cloud web interface.

- 1 Log in to [IBM Cloud](#).
- 2 Go to your [resource list](#).

Getting started with Speech to Text

Last Updated: 2020-02-04

The IBM® Speech to Text service transcribes audio to text to enable speech transcription capabilities for applications. This curl-based tutorial can help you get started quickly with the service. The examples show you how to call the service's `POST /v1/recognize` method to request a transcript.

Before you begin

- Copy the credentials to authenticate to your service instance:
 - On the **Manage** page, click **Show Credentials** to view your credentials.
 - Copy the **API Key** and **URL** values.

Using the curl examples

This tutorial uses the `curl` command to call methods of the service's HTTP interface. Make sure that you have the `curl` command installed on your system.

- To test whether `curl` is installed, run the following command on the command line. If the output lists the `curl` version that supports Secure Sockets Layer (SSL), you are set for the tutorial.
